

Integrated AV and Security Systems for a Large-Scale Coastal Resort

VISION

Support an evolving architectural vision with integrated technology systems that enhance guest experience across entertainment, wellness, conference, and retail environments.

PARTNERSHIP

Collaborate with the architect and all consultants to adapt audiovisual and security systems as design concepts developed over time.

VALUE-ADD

Deliver coordinated AV, broadcast, and security infrastructure that supports both immersive guest amenities and day-to-day operations.

Revel, now known as Ocean Casino Resort, is situated on 20 acres along Atlantic City's Boardwalk. The resort's design approach emphasized artistic expression and flexibility, resulting in a project that evolved continuously throughout development.

Trinity Consultants provided audiovisual and security consulting services across guest-facing amenities, F&B, nightclubs, conference and retail areas, and back-of-house spaces. The scope supported both experiential environments and operational needs within a large, multi-program resort.

VISION

The project called for technology systems that could complement a highly artistic and continually shifting design direction. Audiovisual solutions needed to enhance atmosphere and functionality across diverse resort spaces, from beach club and spa environments to conference and retail areas.

PARTNERSHIP

Trinity Consultants worked closely with Bower Lewis Thrower Architects as the design evolved, adapting audiovisual and security strategies to align with changing spatial and experiential goals. Ongoing coordination supported the realization of the architect's vision across a wide range of resort programs.

VALUE-ADD

Trinity Consultants designed audiovisual systems for a range of guest amenities, including a high-end beach club with a DJ system, full media capabilities within cabanas, and underwater speakers integrated into pool environments. The spa and wellness center was supported with audio throughout all spaces including individualized treatment rooms to maintain a consistent and controlled atmosphere.

Across the broader resort, the team designed a facility-wide broadcast and production system, audiovisual systems for a 22-room electronically configurable conference center, and AV solutions for the retail corridor, which features individual living room-style spaces. Back-of-house services included audiovisual design for conference rooms with videoconferencing capabilities, as well as an executive conference room featuring ceiling-recessed speakers and a 133-inch display.

In addition to audiovisual services, Trinity Consultants provided security access control, video surveillance, and communication network infrastructure supporting voice, data, Wi-Fi, and point-of-sale systems throughout the property.
